DETAILED ACTION

Election/Restrictions

1. Claims 1-10 directed to an allowable product. Pursuant to the procedures set forth in MPEP § 821.04(B), claims 7-10 directed to the process of making or using an allowable product, previously withdrawn from consideration as a result of a restriction requirement, are hereby rejoined and fully examined for patentability under 37 CFR 1.104.

Because all claims previously withdrawn from consideration under 37 CFR 1.142 have been rejoined, **the restriction requirement as set forth in the Office action mailed on 6/19/2006 is hereby withdrawn.** In view of the withdrawal of the restriction requirement as to the rejoined inventions, applicant(s) are advised that if any claim presented in a continuation or divisional application is anticipated by, or includes all the limitations of, a claim that is allowable in the present application, such claim may be subject to provisional statutory and/or nonstatutory double patenting rejections over the claims of the instant application. Once the restriction requirement is withdrawn, the provisions of 35 U.S.C. 121 are no longer applicable. See *In re Ziegler*, 443 F.2d 1211, 1215, 170 USPQ 129, 131-32 (CCPA 1971). See also MPEP § 804.01.

Allowable Subject Matter

2. Claims 1-10 are allowed. The following is an examiner's statement of reasons for allowance: the prior art fails to teach or make obvious A gate driver for forcing a power transistor having a gate electrode insulated with oxide film and also having an input capacitance between the gate electrode and the source electrode, into a conductive state or a shut-off state, the gate driver comprising: a first current source configured to receive a first control signal and to output a first current value to charge said input capacitance and raise an electric potential of the gate

electrode in a time corresponding to a charging time of said input capacitance, when changing the power transistor from the shut-off state to the conductive state, the first current value depending on a level of the first control signal; and a second current source configured to receive a second control signal and to output a second current value to discharge said input capacitance and lower the electric potential of the gate electrode in a time corresponding to the charging time of said input capacitance, when changing said power transistor from the conductive state to the shut-off state, the second current value depending on a further level of the second control signal; wherein the levels of the first and second control signals are independently controlled, wherein the time of change from the shut-off state to the conductive state of the power transistor is controlled by controlling the rise time of the electric potential of said gate electrode with the first current value set with the first control signal, while the time of change from the conductive state to the shut-off state of the power transistor is controlled by controlling the fall time of the electric potential of said gate electrode with said second current value set with the second control signal.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
